Expert

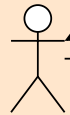

Outlier Expectation

Param Finder

Top Params

Hyper-Parameter Optimization

The expert provides her estimation of the proportion of outlier records. Param Finder applies a wide range of hyperparameters and ranks the results based on their similarity to the expert's expectations.

Expert

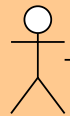

Chosen Params

DBSCAN

Cleans Outliers

Outlier Detection by Clustering

The expert selects a set of parameters, which are then used by the DBSCAN algorithm to identify and remove outliers.

Expert

Weights

Calculate Weighted Distances

Distributions

Distance Distributions

Calculation of Weighted Distances

Using the feature weights provided by the expert, the weighted Euclidean distance of each record from its corresponding cluster's geometric median is calculated.

Expert

Thresholds

Cleaning Final Outliers

Outlier Detection by Distance

For each cluster, the expert sets a cutting threshold. This threshold is then used to eliminate records that exceed it
